RESUME KIT · AI ENGINEERING & DATA SCIENCE

Get shortlisted, not filtered.

A note from **Shivank Agrawal**

Most AI and Data Science resumes never reach a human. A screening system (ATS) filters them out first, and the reason is rarely your skills. It's a two-column layout, missing keywords from the job description, or bullets with no numbers. Good engineers stay invisible because of this. This kit is the playbook to fix it. Start with this page, follow the plan, and your resume will be ready in a week.

01 What's inside

01	**Quick Guide** 25 slides · read first	How AI hiring works across all 5 stages, from screening to team fit, and what every resume section must show. About 20 minutes.
02	**Full Guide** 72 pages · the deep dive	What to write in each section, how to pass ATS, 10 mistakes that cost interviews, a FAANG data science resume breakdown, and a step-by-step plan to build an industry-level AI project.
03	**Word Template** .docx	Clean, single-column and ATS-friendly. Fill it in and export as PDF.
04	**LaTeX Template** .tex · open in Overleaf	Comes filled with a sample AI Engineer resume so you can see what strong bullets look like. Replace everything with your own.
05	**Heatmap Example** .png	One picture that shows why numbers matter. See the next page.

02 Your 7-day plan

DAY 1
Read the Quick Guide
End to end. Note the 3 things your current resume gets wrong.

DAY 2
Rebuild in one template
1 page. Standard titles: Experience, Education, Projects, Skills. No columns, icons or graphics.

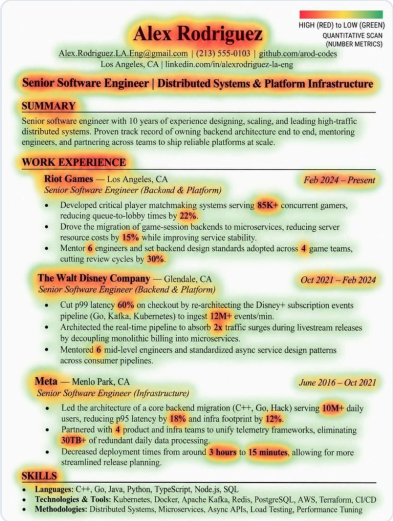

DAY 3
Put a number in every bullet
Use the formula: **Accomplished X, measured by Y, by doing Z.**

DAY 4
Match one real job
Pick a job description you want. Mirror its keywords in your summary and skills, only where true.

DAY 5
Test every link
Click every GitHub, LinkedIn and demo link. Fix anything broken or private.

DAY 6–7
Upgrade your best project
Run it through the portfolio checklist at the end of the Full Guide. Add what's missing: README, baseline, evaluation, demo, deployment.

03 See what stands out

Numbers are what a recruiter remembers.

This heatmap highlights every number on a sample resume: **red** where numbers are, **green** where there are none.

Look at what glows: **85K+ users**, **60% latency cut**, **3 hours → 15 minutes**. Now look at the Summary. All green. No numbers, nothing sticks.

Before you call your resume done, check every bullet: does it have a number? If not, find the real one and add it.

This sample is a backend engineer's resume. Use it for the numbers lesson; use the templates (03, 04) for structure.

04 Let AI do the heavy lifting

Copy-paste these into ChatGPT, Claude or Gemini. Attach your resume where it says so.

1 Fill the template, no LaTeX needed

> Here is my current resume and a LaTeX resume template. Put my details into this template, 1 page max. Don't add anything I haven't given you.

Paste the output into Overleaf → Recompile → Download PDF.

2 Make every bullet hit hard

> Rewrite each bullet as: Accomplished X, measured by Y, by doing Z. If a bullet has no number, don't invent one. Ask me questions to find the real number.

3 Match a specific job

> Here is a job description and my resume. List the top 15 keywords from the JD, mark which are missing from my resume, and suggest where I can honestly add them.

4 Turn a project into bullets

> Here is my GitHub README. Write 2–3 resume bullets: problem, solution + tech stack, impact with metrics. Then tell me what's missing: baseline, evaluation, failure cases, deployment, demo.

5 Full ATS audit

Use the ready-made ATS checker prompt on **page 25 of the Full Guide**. Then cross-check for free on **Jobscan** or **Resume Worded**.

6 Practise before the real interview

> Act as an interviewer for [role]. Ask me 10 questions based only on my resume, one at a time, and give feedback on each answer.

GOLDEN RULE

AI polishes. You bring the facts. Never put a number on your resume that you can't explain in an interview. Every line is fair game.

All the best,
Shivank Agrawal
